Marking Scheme

- Quiz in class (10%)
- Homework assignments (20%)
 - assigned in class and posted on the course webpage
 - must be submitted online before due date
 - no extension policy with exceptions
- Midterm exam (30%)
 - ⋄ To be announced
 - covers the first half of class material
- Final exam (40%)
 - covers the entire semester's material
- Project (5%, optional)

Important Messages to Students

- Main ideas will be covered in class but some details might be skipped. You are responsible for all materials in assigned sections of book, even if they are not taught in class.
- Homework assignments should be worked on and written up individually, though group discussions are allowed.
- Any unintellectual behavior and cheating on exams, homework assignments will be dealt with severely.
- If you get the main idea for a solution from someone else or a website, you must acknowledge that source in your submission.

Plagiarism Policy

- * If an undergraduate assignment is found to be plagiarized, the first time the score of the assignment will be 0.
- * The second time the score of the course will be 0.

As it may be difficult when two assignments are identical or nearly identical who actually wrote it, the policy will apply to BOTH students, unless one confesses having copied without the knowledge of the other.

What is OK and what is not OK?

- It's OK to work on an assignment with a friend, and think together about the program structure, share ideas and even the global logic. At the time of actually writing the code, you should write it alone.
- It's OK to use in an assignment a piece of code found on the web, as long as you indicate in a comment where it was found and don't claim it as your own work.
- It's OK to help friends debug their programs (you'll probably learn a lot yourself by doing so).
- It's OK to show your code to friends to explain the logic, as long as the friends write their code on their own later.

It's NOT OK to take the code of a friend, make a few cosmetic changes (comments, some variable names) and pass it as your own work.

What is OK and what is not OK?

Important Messages to Students

Please ask questions in class

If you're having trouble understanding something, then at least 50% of the class is also having trouble: they'll be happy if you ask for more explanation.

The lecture slides are still in progress

If you find mistakes or just think that something's confusing, please email me. Your classmates and future students will *thank you*.

Discrete Mathematics

- What is discrete mathematics?
 - ⋄ Discrete mathematics is the study of mathematical structures that are fundamentally <u>discrete</u> rather than <u>continuous</u>.

For example, integers, graphs, statements in logic, etc.

⋄ Discrete mathematics therefore excludes topics in "continuous mathematics" such as Calculus and Analysis.

Discrete Mathematics

- What is discrete mathematics?
 - ♦ Discrete mathematics is the study of mathematical structures that are fundamentally <u>discrete</u> rather than <u>continuous</u>.
 - For example, integers, graphs, statements in logic, etc.
 - ⋄ Discrete mathematics therefore excludes topics in "continuous mathematics" such as Calculus and Analysis.

Some applications

- Computer science: algorithms, programming languages, cryptography, artificial intelligence, ...
- Electronic engineering: digital communications, signal processing, information theory, coding theory, ...

Discrete Mathematics

The Abel Prize Laureates 2021

The Norwegian Academy of Science and Letters has decided to award the Abel Prize for 2021 to

László Lovász

of Alfréd Rényi Institute of Mathematics (ELKH, MTA Institute of Excellence) and Eötvös Loránd University in Budapest, Hungary, and

Avi Wigderson

of the Institute for Advanced Study, Princeton, USA

"For their foundational contributions to <u>theoretical computer science</u> and <u>discrete mathematics</u>, and their leading role in shaping them into **central fields** of modern mathematics."

Topics of This Course

- Propositional and Predicate Logic
- Mathematical Proofs
- Sets
- Functions
- Complexity of Algorithms
- Number Theory
- Groups, Rings, and Fields*
- Cryptography

- Mathematical Induction
- Recursion
- Counting
- Discrete Probability*
- Relations
- Graphs
- Trees
- Finite Fields*

Lecture Schedule (Tentatively)

- 01. Logic
- 02. Mathematical Proofs
- 03. Sets and Functions
- 04. Complexity of Algorithms
- 05. Number Theory
- 06. Groups, Rings and Fields*
- 07. Cryptography
- 08. Midterm Exam

- 09. Mathematical Induction
- 10. Recursion
- 11. Counting
- 12. Discrete Probability
- 13. Relations
- 14. Graphs I
- 15. Graphs II
- 16. Trees and Review Lecture

Learning Objectives

- Be able to read, understand, and construct mathematical arguments and proofs
- Understand the formulation of common problems in several areas of discrete mathematics, including counting, graphs, number theory, cryptography, logic and proof, recursions, probability theory, finite fields, etc.
- Learn a number of discrete mathematical tools
- Apply discrete mathematical tools to solve certain problems in computer science and electronic engineering

Some of slides are based on lecture material used in the following institutions:

Massachusetts
Institute of
Technology

Q. 1 Prove that "For an integer n, if 3n + 2 is odd, then n is odd".

Q. 1 Prove that "For an integer n, if 3n + 2 is odd, then n is odd".

Proof I (direct proof)

Note that 3n + 3 is even, and so is n + 1. It then follows that n is odd.

Q. 1 Prove that "For an integer n, if 3n + 2 is odd, then n is odd".

Proof II (proof by contrapositive)

It is *equivalent* to prove that "If n is even , then 3n + 2 is even." – Why?

w.l.o.g. suppose that n = 2k for some integer k, then

$$3n + 2 = 6k + 2$$
,

which is even.

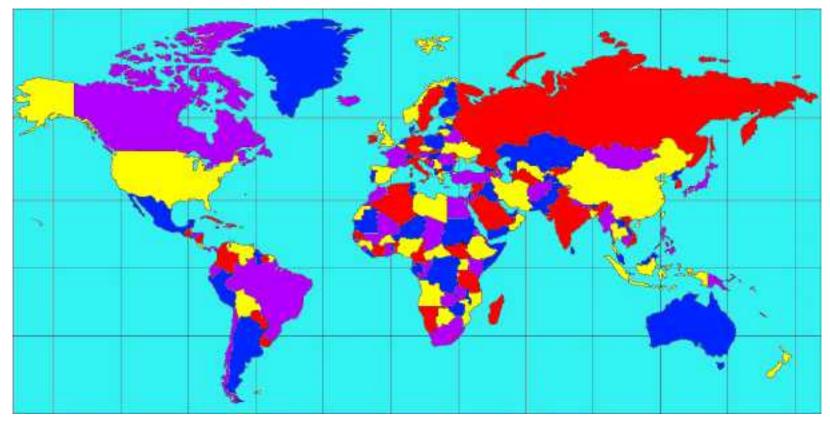

Q. 1 Prove that "For an integer n, if 3n + 2 is odd, then n is odd".

Proof III (proof by contradiction)

Assume to the contrary that there exists an integer n such that 3n + 2 is odd and n is even. Since n is even, so is 3n. Then 2 must be odd, leading to a contradiction.

■ Four-color theorem Given any separation of a plane into contiguous regions, producing a figure called a *map*, no more than four colors are required to color the regions of the map so that no two adjacent regions have the same color.

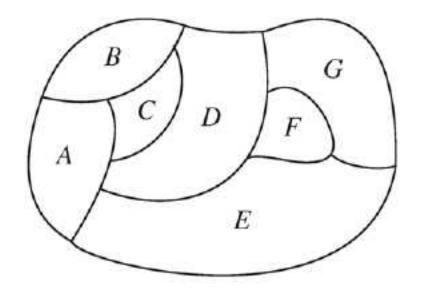

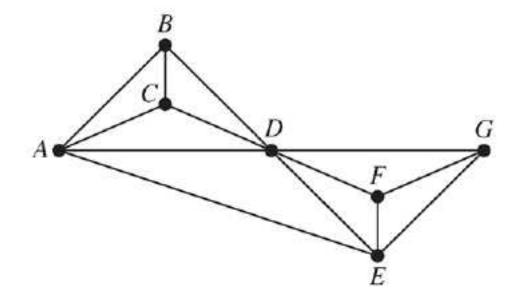

- Four-color theorem (for planar graphs)
 - first proposed by Francis Guthrie in 1852
 - his brother Frederick Guthrie told Augustus De Morgan
 - De Morgan wrote to William Hamilton
 - Alfred Kempe proved it incorrectly in 1879
 - Percy Heawood found an error in 1890 and proved the five-color theorem
 - ♦ Finally, Kenneth Appel and Wolfgang Haken proved it with case by case analysis by computer in 1976 (the first computeraided proof)
 - Kempe's incorrect proof serves as a basis

Four-color theorem

- Applications of graph colorings
 - ♦ Scheduling Final Exams

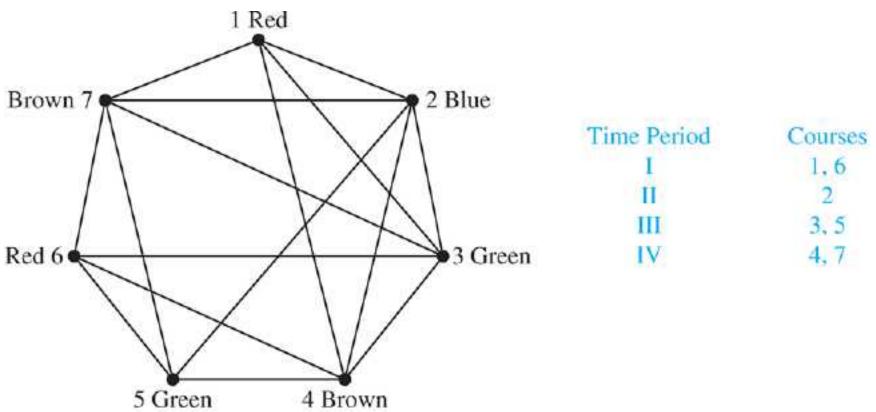

Vertices represent courses, and there is an edge between two vertices if there is a common student in the courses.

Applications of graph colorings

♦ Scheduling Final Exams

Vertices represent courses, and there is an edge between two vertices if there is a common student in the courses.

- Applications of graph colorings
 - ♦ Scheduling Final Exams

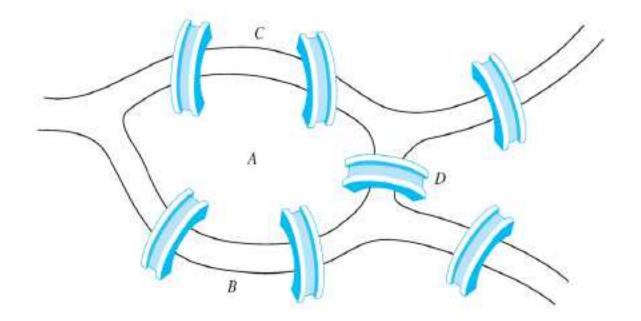

Vertices represent courses, and there is an edge between two vertices if there is a common student in the courses.

♦ Graph coloring is computationally hard! (?)

Königsberg seven-bridge problem

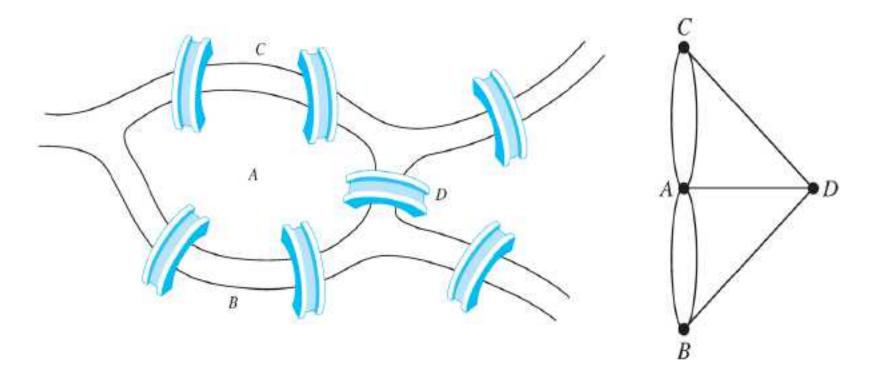

People wondered whether it was possible to start at some location in the town, travel across all the bridges once without crossing any bridge twice, and return to the starting point.

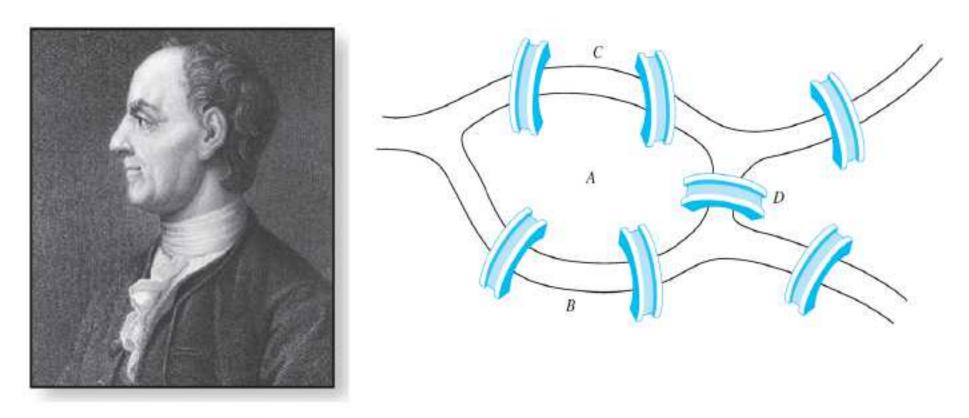

Königsberg seven-bridge problem

People wondered whether it was possible to start at some location in the town, travel across all the bridges once without crossing any bridge twice, and return to the starting point.

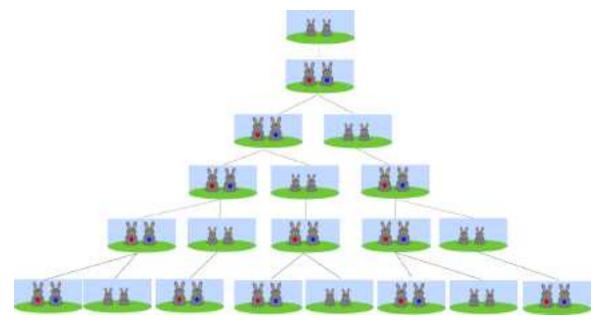

Königsberg seven-bridge problem

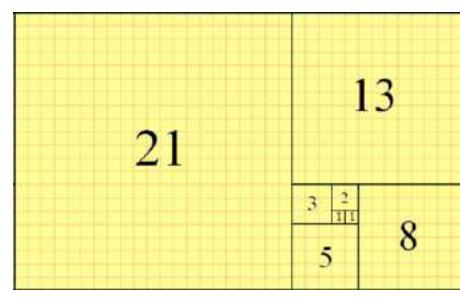

Leonhard Euler

Theorem A connected multigraph with at least two vertices has an *Euler circuit* if and only if each of its vertices has **even** degree.

■ Fibonacci number

■ Fibonacci number

$$F_0 = 0$$
, $F_1 = 1$, $F_n = F_{n-1} + F_{n-2}$ for $n \ge 2$

Problem IV

■ Fibonacci number

$$F_0 = 0$$
, $F_1 = 1$, $F_n = F_{n-1} + F_{n-2}$ for $n \ge 2$

 \diamond What is the closed-form expression of F_n ?

Problem IV

■ Fibonacci number

$$F_0 = 0$$
, $F_1 = 1$, $F_n = F_{n-1} + F_{n-2}$ for $n \ge 2$

 \diamond What is the closed-form expression of F_n ?

Consider $x^n = x^{n-1} + x^{n-2}$, with $x \neq 0$. There are two different roots

$$\phi = \frac{1+\sqrt{5}}{2}, \quad \psi = \frac{1-\sqrt{5}}{2}$$

Then F_n can be the form of $a\phi^n + b\psi^n$. By $F_0 = 0$ and $F_1 = 1$, we have a + b = 0 and $\phi a + \psi b = 1$, leading to $a = \frac{1}{\sqrt{5}}$, b = -a. Therefore,

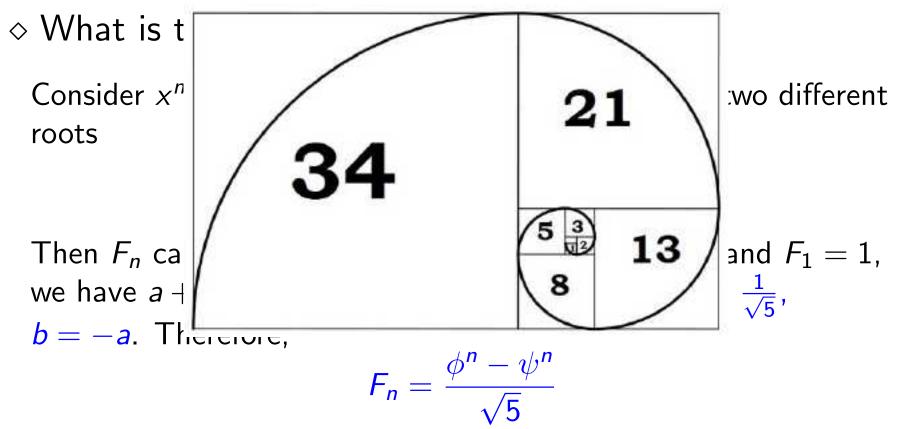

$$F_n = \frac{\phi^n - \psi^n}{\sqrt{5}}$$

Problem IV

■ Fibonacci number

$$F_0 = 0$$
, $F_1 = 1$, $F_n = F_{n-1} + F_{n-2}$ for $n \ge 2$

Let's start!

"All you need is a cool head, a large sheet of paper, and a fairly decent handwriting."

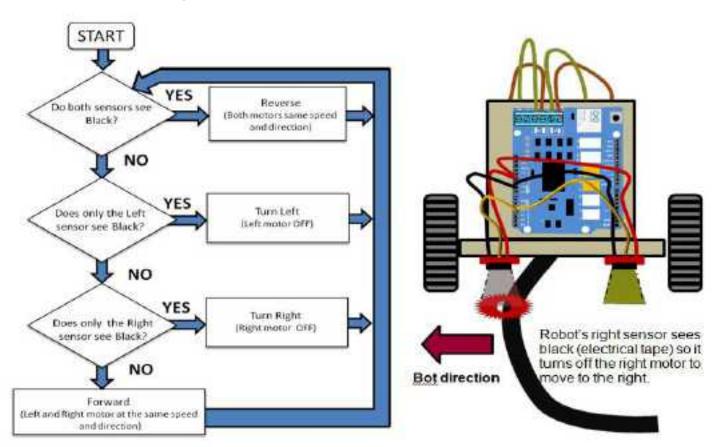

Logic

- Logic is the basis of all mathematical reasoning.
 - ♦ syntax of statements
 - ♦ the *meaning* of statements
 - the rules of logical inference

Logic

- Logic is the basis of all mathematical reasoning.
 - ♦ syntax of statements
 - ♦ the *meaning* of statements
 - the rules of logical inference

A *proposition* is a declarative statement that is either true or false.

A proposition is a declarative statement that is either true or false.

Examples:

♦ SUSTech is located in Shenzhen. (T)

$$\diamond 1 + 1 = 2 (T)$$

$$\diamond 2 + 2 = 3 (F)$$

A proposition is a declarative statement that is either true or false.

Examples:

♦ SUSTech is located in Shenzhen. (T)

$$\diamond 1 + 1 = 2 (T)$$

$$\diamond 2 + 2 = 3 (F)$$

"declarative" + "either true or false"

A proposition is a declarative statement that is either true or false.

Examples:

♦ SUSTech is located in Shenzhen. (T)

$$\diamond 1 + 1 = 2 \ (\mathsf{T})$$

$$\diamond 2 + 2 = 3 (F)$$

"declarative" + "either true or false"

- ♦ No parking.
- ♦ How old are you?

$$\diamond x + 2 = 5$$

She is very talented.

Propositions

- What about the following?
 - There are infinitely many twin prime numbers.
 - ♦ This is an unsettled conjecture (a.k.a. twin-prime conjecture).
 - There are other life forms on other planets in the universe.

Propositions

- What about the following?
 - There are infinitely many twin prime numbers.
 - ♦ This is an unsettled conjecture (a.k.a. twin-prime conjecture).
 - There are other life forms on other planets in the universe.

- Usually, a proposition is condition-based.
 - ♦ If you would donate 1 billion, you will become the president.

Compound Propositions

• More complex propositions can be built from elementary statments using logical connectives.

Compound Propositions

 More complex propositions can be built from elementary statments using logical connectives.

Example:

- ♦ Proposition A: It rains outside.
- ♦ Proposition B: We will watch a movie.
- ♦ A new proposition: If it rains outside then we will watch a movie.

Compound Propositions

• More complex propositions can be built from elementary statments using logical connectives.

Logical connectives:

- ♦ Negation
- ⋄ Conjunction
- ♦ Disjunction
- ♦ Exclusive or
- ♦ Implication
- ⋄ Biconditional

Let p be a proposition. The statment "It is not the case that p." is called the *negation of* p, denoted by $\neg p$, and read as "not p".

Let p be a proposition. The statment "It is not the case that p." is called the *negation of* p, denoted by $\neg p$, and read as "not p".

Examples:

```
\diamond p – SUSTech is located in Shenzhen. (T)
```

 $\diamond \neg p$ – SUSTech is not located in Shenzhen. It is not the case that SUSTech is located in Shenzhen.

Let p be a proposition. The statment "It is not the case that p." is called the *negation of* p, denoted by $\neg p$, and read as "not p".

Examples:

- $\diamond p$ SUSTech is located in Shenzhen. (T)
- $\diamond \neg p$ SUSTech is not located in Shenzhen. It is not the case that SUSTech is located in Shenzhen.

$$\diamond$$
 5 + 2 \neq 8

- ♦ 10 is not a prime number.
- ♦ It is not the case that classes begin at 8:00am.

A truth table displays the relationships between truth values (T or F) of different propositions.

p	$\neg p$
T	F
F	T

A truth table displays the relationships between truth values (T or F) of different propositions.

p	$\neg p$
T	F
F	T

Rows: contains all possible values of elementary propositions.

Conjunction (and)

Let p and q be propositions. The *conjunction* of p and q, denoted by $p \wedge q$, is true when both p and q are true and is false otherwise.

Conjunction (and)

Let p and q be propositions. The *conjunction* of p and q, denoted by $p \wedge q$, is true when both p and q are true and is false otherwise.

Examples:

- ⋄ p − SUSTech is located in Shenzhen.
- $\diamond q 5 + 2 = 8$
- $\diamond p \land q$ SUSTech is located in Shenzhen and 5+2=8

Conjunction (and)

Let p and q be propositions. The *conjunction* of p and q, denoted by $p \land q$, is true when both p and q are true and is false otherwise.

Examples:

- ⋄ p − SUSTech is located in Shenzhen.
- $\diamond q 5 + 2 = 8$
- $\diamond p \land q$ SUSTech is located in Shenzhen and 5+2=8
- \diamond There are infinitely many twin prime numbers and 2 + 2 = 3
- ♦ 2 is a prime number and 9 is a prime power.

Disjunction (or)

Let p and q be propositions. The *disjunction* of p and q, denoted by $p \lor q$, is false when both p and q are false and is true otherwise.

Disjunction (or)

Let p and q be propositions. The *disjunction* of p and q, denoted by $p \lor q$, is false when both p and q are false and is true otherwise.

Examples:

- $\diamond p$ SUSTech is located in Shenzhen.
- $\diamond q 5 + 2 = 8$
- $\diamond p \lor q$ SUSTech is located in Shenzhen or 5+2=8

Disjunction (or)

Let p and q be propositions. The *disjunction* of p and q, denoted by $p \lor q$, is false when both p and q are false and is true otherwise.

Examples:

- ⋄ p − SUSTech is located in Shenzhen.
- $\diamond q 5 + 2 = 8$
- $\diamond p \lor q$ SUSTech is located in Shenzhen or 5+2=8
- \diamond There are infinitely many twin prime numbers or 2+2=3
- ♦ 2 is a prime number or 9 is a prime power.

Truth Tables

ightharpoonup p
ightharpoonup q is read in a variety of equivalent ways:

```
\diamond if p then q \diamond p implies q
```

- $\diamond p$ is sufficient for q
- $\diamond q$ is necessary for p
- $\diamond q$ follows from p
- $\diamond q$ unless $\neg p$
- $\Leftrightarrow p$ only if q

ightharpoonup p
ightharpoonup q is read in a variety of equivalent ways:

```
\diamond if p then q
```

- $\diamond p$ implies q
- $\diamond p$ is sufficient for q
- $\diamond q$ is necessary for p
- $\diamond q$ follows from p
- $\diamond q$ unless $\neg p$
- $\diamond p$ only if q

Example:

 \diamond If you get 100 on the final, then you will get an A.

p

q

■ The *converse* of $p \rightarrow q$ is $q \rightarrow p$. The *contrapositive* of $p \rightarrow q$ is $\neg q \rightarrow \neg p$. The *inverse* of $p \rightarrow q$ is $\neg p \rightarrow \neg q$.

The *converse* of $p \rightarrow q$ is $q \rightarrow p$. The *contrapositive* of $p \rightarrow q$ is $\neg q \rightarrow \neg p$. The *inverse* of $p \rightarrow q$ is $\neg p \rightarrow \neg q$.

Examples:

- \diamond If you get 100 on the final, then you will get an A. $(p \rightarrow q)$
- \diamond If you get an A, then you get 100 on the final. $(q \rightarrow p)$
- \diamond If you don't get an A, then you don't get 100 on the final. $(\neg q \rightarrow \neg p)$
- \diamond If you don't get 100 on the final, then you don't get an A. $(\neg p \rightarrow \neg q)$

The *converse* of $p \rightarrow q$ is $q \rightarrow p$. The *contrapositive* of $p \rightarrow q$ is $\neg q \rightarrow \neg p$. The *inverse* of $p \rightarrow q$ is $\neg p \rightarrow \neg q$.

Examples:

- \diamond If you get 100 on the final, then you will get an A. $(p \rightarrow q)$
- \diamond If you get an A, then you get 100 on the final. $(q \rightarrow p)$
- \diamond If you don't get an A, then you don't get 100 on the final. $(\neg q \rightarrow \neg p)$
- \diamond If you don't get 100 on the final, then you don't get an A. $(\neg p \rightarrow \neg q)$

$$\neg q \rightarrow \neg p$$
 is equivalent to $p \rightarrow q$

Biconditional

Let p and q be propositions. The *biconditional* statment (a.k.a. *bi-implications*) $p \leftrightarrow q$, is the proposition "p if and only if q", is true when p and q have the same truth values, and false otherwise.

Biconditional

- Let p and q be propositions. The *biconditional* statment (a.k.a. *bi-implications*) $p \leftrightarrow q$, is the proposition "p if and only if q", is true when p and q have the same truth values, and false otherwise.
 - $\diamond p$ is necessary and sufficient for q
 - \diamond if p then q, and conversely
 - $\diamond p \text{ iff } q$

Biconditional

Let p and q be propositions. The *biconditional* statment (a.k.a. *bi-implications*) $p \leftrightarrow q$, is the proposition "p if and only if q", is true when p and q have the same truth values, and false otherwise.

- $\diamond p$ is necessary and sufficient for q
- \diamond if p then q, and conversely
- $\diamond p \text{ iff } q$

T	F	F
F	T	F
F	F	T

- A proposition is a declarative statement that is either true or false. More complex propositions can be built from elementary statements using logical connectives.
- Logical connectives:

```
p: 2 is a prime (T)q: 6 is a prime (F)
```

- p: 2 is a prime (T)q: 6 is a prime (F)
- Determine the truth value of the following.

$$eg p$$
 $eg p \land q$
 $eg p \lor q$
 $eg p \oplus q$
 $eg p \to q$
 $eg p \to p$

```
p: 2 is a prime (T)q: 6 is a prime (F)
```

Determine the truth value of the following.

$$eg p$$
 $eg p \land q$
 $eg p \land \neg q$
 $eg p \lor q$
 $eg p \oplus q$
 $eg p \to q$
 $eg p$

Constructing the Truth Table

■ Construct a truth table for $p \lor q \rightarrow \neg r$

Constructing the Truth Table

■ Construct a truth table for $p \lor q \rightarrow \neg r$

p	q	r	¬r	p∨q	$p \lor q \rightarrow \neg r$

Computer Representation of True and False

A bit is sufficient to represent two possible values:
 0 (false) or 1 (true)

A varaiable that takes on values 0 and 1 is called a Boolean variable.

A bit string is a sequence of zero or more bits. The length of this string is the number of bits in the string.

Computer Representation of True and False

- A bit is sufficient to represent two possible values:
 0 (false) or 1 (true)
- A varaiable that takes on values 0 and 1 is called a Boolean variable.
- A bit string is a sequence of zero or more bits. The length of this string is the number of bits in the string.
- bitwise operations: replace "T" and "F" with 1 and 0.

```
1011 0011 

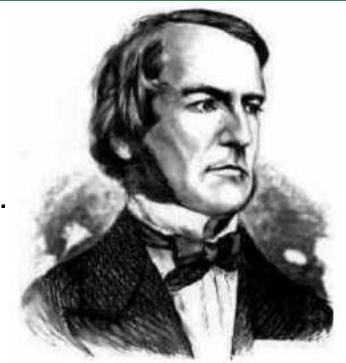

> 0110 1010 

1111 1011
```

George Boole

- British mathematician (b. 1815, d. 1864)
 - ♦ The inventor of Boolean algebra
 - ⋄ Truth tables are an example of B.A.

♦ Although Booles's work was not originally perceived as particularly interesting, even by other mathematicians, he is now seen as one of the founders of the field of Computer Science.
